

FastSCAN Scorpion Scanning System

Today, Yanke Bionics is **one of only two facilities** in the United States to offer the **FastSCAN Scorpion** system, the next generation of computer imaging and fabrication in the field.

FastSCAN Scorpion is the first system ever to offer the capability of two cameras in a hand held wand that directly scans the patient's residual limb in order to create an exact computer image of the limb.

This results in a three-dimensional model which when loaded into the **BioSculptor** software allows the prosthetist to design a prosthesis that provides as close to perfect fit as is allowed by technology available today.

Additionally, the FastSCAN Scorpion and BioSculptor software store each patient's file for easy future reference, often eliminating additional trips to the office for our patients.
